## **HEADLIGHT RESTORATION FOAM IN SPRAY**

Protective gloves.

Solvent resistant gloves.

Selection of the glove material on consideration of the breakthrough times, rates of diffusion and degradation.

### **Material of gloves:**

The selection of the suitable gloves does not only depend on the material, but also on further marks of quality and varies from manufacturer to manufacturer. As the product is a preparation of several substances, the resistance of the glove material cannot be calculated in advance and has therefore to be checked prior to application.

Nitrile rubber.

Recommended thickness of the material:  $\geq 0.5$  mm.

### **Penetration time of the glove material:**

For continuous contact we recommend gloves with breakthrough time of at least 240 min. with the preference given to a breakthrough time greater than 480 min. For short-term or splash guard we recommend the same. We are aware that suitable gloves that offer this level of protection may not be available. In that case, a shorter breakthrough time are acceptable as long as the procedures governing maintenance and timely replacement are followed. The thickness of the gloves is not a good measure of the resistance of the gloves against a chemical substance, because this depends on the exact composition of the material from which the gloves are made.

The exact break through time has to be found out by the manufacturer of the protective gloves and has to be observed.

### **Eye/face protection:**

Safety glasses

Tightly sealed goggles.

### **Body protection:**

Use protective suit (EN-13034/ 6)

Full skin covering antistatic, chemical and oil resistant clothing and safety shoes (EN1149; EN340&EN ISO 13688; EN13034-6) are recommended.

### **Environmental control**

Use an appropriate container to prevent environmental contamination.
